

ABSTRACT

In a method and a device for notifying a server failure recovery which notify a failure recovery of a server or the like to a client, a
5 server failure detector detects a client having tried but failed to access
a server due to a failure, a server recovery detector detects a failure
recovery, and a server recovery notifier gives a failure recovery
notification to the client having failed to access. Also, the server failure
recovery notification device is mounted on a router. The server failure
10 detector detects the client having failed to access based on a
destination unreachable message of an ICMP of the router 40, or
detects the client having failed to access by determining the failure is
being occurred in the server, in the absence of a reply IP packet to the
IP packet addressed to the server from the client.
